

makeSEA + Catapult

for Museums and Kiosk Use

makeSEA 3D spatial computing tools can enhance an existing kiosk display or be used for new installations on their own.

makeSEA is able to facilitate VR experiences for any venue, at a fraction of the production cost of physical infrastructure. We also provide easy Web-based content management tools to allow you to update branding, content, and messaging without writing custom software.

The makeSEA 3D spatial computing platform can be offered to augment existing kiosks or displays or create entirely new virtual displays that take up no space at all. We can cast any type of content (2D, video, and 3D).

With the inclusion of the 3D spatial computing tools and a VR or XR compatible device you can:

- Provide virtual displays with a wow factor for fund raising efforts.
- Build buzz and increase foot traffic to your venue.
- Give more in-depth details on the topic visually. This immersive experience builds interest and deeper learning.
- Provide new options for strategy. New displays can be added without the need for more physical space.
- Easily make changes to existing displays to keep your audience engaged without having to rebuild existing infrastructure.
- Create virtual self-guided tours of your facility.
