

makeSEA + Catapult

for Builders of Custom Trade Show Installations

Offer the makeSEA 3D spatial computing tools as a premium enhancement for custom designed installations.

makeSEA is able to facilitate XR experiences for any show booth, at a fraction of the production cost of physical infrastructure with a VR or XR compatible device. We also provide easy Web-based content management tools to allow customers to update branding, content, and messaging without writing custom software or having to update custom mobile applications.

The makeSEA 3D spatial computing platform can be offered to augment existing booths or create entirely virtualized booths. We can cast any type of content (2D, video, and 3D).

With the inclusion of the 3D spatial computing tools your clients can:

- Build buzz and increase foot traffic to their booth.
- Wow competitors with the use of advanced 3D visualization technology.
- Increase productivity and save on time and costs. Customers can try before they buy and view options in real time—leading to better consumer satisfaction, fewer returns, fewer post-sale hassles.
- Showcase new products in real time—even without the product on-site.
- Give more in-depth details on the product visually. This immersive shopping experience builds customer interest and confidence.
